

Architectural marvels in wood! Material and technical assistance by Canadian Wood.

The aesthetic appeal and proven effectiveness of wood as a building material has endeared itself to architects, builders and end consumers worldwide. Increasingly, developers and the hospitality industry in India are looking at projects in wood specifically in the country homes, farmhouses and resorts segments. There has also been a rising emphasis on the use of wood in interiors, doors/windows and furniture.

Exactly why, Canadian Wood has been directing its efforts towards sharing best practices by organizing seminars and training workshops for its stakeholders, both in structural and reman applications. All this with a specific focus on developing local skills and expertise to execute world-class products/projects that makes them commercially viable.

Here is a quick view into all the demo projects showcasing structural and reman applications in wooden homes and resorts using a variety of Canadian wood species, best suited to the application.

The structures depicted in the pictures have been made using different building techniques like Wood Frame, Tongue & Groove, Post & Beam (including Glulam) and even Hybrid (wood in tandem with local stone or bricks) as per needs, budgets and weather conditions.

CERTIFIED LUMBER SOURCED FROM BRITISH COLUMBIA, CANADA – WORLD LEADER IN SUSTAINABLE FOREST MANAGEMENT.

Growing stockists network.

Canadian wood is 100% certified and sourced from sustainably managed forests. It is available pan India through a network of 41 stockists across 23 cities. We are further expanding our reach and working towards making our species easily accessible to our clients.

READY-TO-USE, SIZED, GRADED AND SEASONED LUMBER.

Benefits of Canadian Wood species.

Canadian Wood promotes five distinct species in India, namely, spruce-pine-fir (S-P-F), western hemlock, Douglas-fir, yellow cedar and western red cedar. All these species are well-known for their easy workability, excellent staining, good screw holding and gluing properties. Besides, they also have a very good strength-to-weight ratio. The two cedar species are naturally durable (can withstand varying climatic conditions) and resistant to decay.

The pictures on the left refer to highly creative use of western hemlock in hand-painted chic furniture. It is also used by manufacturing hubs in northern India to make and export world-class products to leading furniture brands in North America, Europe and ANZ.
